## **Data extracted: 24-08-2011**

The Quarterly panorama of European business statistics has the objective of furnishing readers with an instrument which will allow them to follow the evolution of short-term economic trends in relation to the business sector of the economy (as defined by NACE Rev. 2 Sections B to N).

This is the third edition of the publication in 2011; it is produced by Eurostat Unit G3 - responsible for short-term business statistics (STS). The publication is released on a regular, quarterly basis.

The STS database is based on the NACE Rev. 2 classification and the base year for indices is currently 2005=100. The classification (NACE Rev. 2) has been modernised by introducing new detail to reflect different forms of production and emerging industries. The detail of the classification has substantially increased in service-producing activities. NACE Rev. 2 provides a better picture of the overall economy and facilitates international comparisons.

The publication follows the structure of the STS Regulation, insofar as it presents a selection of key indicators for industry, construction, retail trade and other services. Among the most important indicators are a set of Principal European Economic Indicators (PEEIs) that are essential to the European Central Bank for reviewing monetary policy within the euro area.

Data sources are included under each table and graph throughout the publication. The codes that may be found as part of the source have been introduced to allow readers to easily access the most recent data on Eurostat's website. By clicking on these hyper-links in the PDF version of the publication, users are led directly to the relevant table on Eurostat's website. The links open complete data sets in a web browser using Eurostat's Data Explorer application. Note that the data on the website is frequently updated and may also be more detailed or be available in a variety of different measurement units (these can be modified by using the Select Data tab in the application).

Index of turnover - security and investigation activities; office administrative, office support and other business support activities	183
Indices of output prices for services	184
<b>5. Methodological notes</b>	<b>187</b>

Readers may be interested to learn that a set of **main tables** are available for STS on the Eurostat website. These cover some of the key short-term business statistics across the whole of the business economy. The data is automatically updated from the latest information available within Eurostat databases. The indicators are divided according to the annexes of the short-term statistics regulation (STS-R).

## Industry

### Index of production

The seasonally adjusted index of production for total industry (excluding construction) fell by 1.2 % in the EU-27 in June 2011 when compared with the month before; the corresponding rate of change for the euro area was -0.7 %. These latest figures followed on from two successive months of relatively modest growth, as EU-27 industrial production had risen by 0.3 % in April and 0.2 % in May 2011 (0.2 % for both months in the euro area).

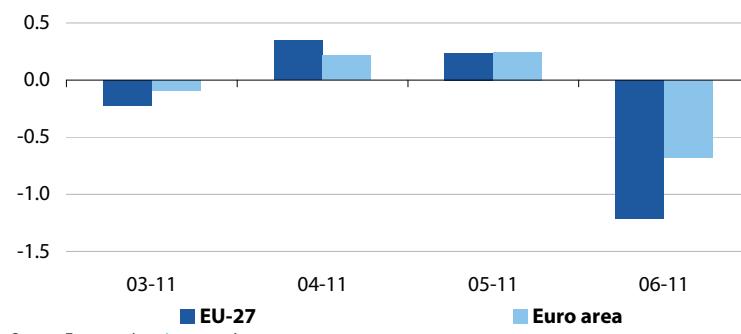

Concerns over the possibility of a slowdown in global economic activity, coupled with debate over the sustainability of public finances both within and outside the EU, led to equity markets being very volatile, and generally following a downward path. The concerns over a loss of momentum in the recovery that many countries had been experiencing were borne out in the latest quarterly indices for industrial production. EU-27 output rose by just 0.1 % in the second quarter of 2011 when compared with the quarter before – marking a considerable slowdown in activity, as growth had peaked at 2.5 % in the second quarter of 2010, been above 1 % in the second half of 2010, and just under this level (at 0.9 %) in the first quarter of 2011.

In Germany, industrial production continued to rise, up 1.2 % in the second quarter of 2011. However, the latest figures were well below the peak in activity recorded in the final quarter of 2010, when German output had risen by 2.7 %. Further evidence for a slowdown in German industrial activity was also provided by the latest business climate indicators, which showed the IFO index falling to its lowest level in more than a year in August 2011. Looking at the latest monthly data, industrial output in Germany was 0.8 % lower in June 2011 than it had been the month before, while there were contractions of a similar magnitude in Italy (-0.6 %) and Spain (-0.8 %). There was an even larger month on month contraction in industrial output in France (-1.7 %) in June 2011, while there was no change in the level of activity in the United Kingdom.

Further evidence of a slowdown in activity was provided by the growth rate for the working day adjusted index of production for total industry, which may be used to analyse growth in relation to the same period of the year before. This indicator peaked in December 2010 at 8.5 % for the EU-27 and 8.9 % for the euro area. In the six months that followed, EU-27 growth rates decelerated, culminating in their largest single drop, as the pace at which output was expanding fell from 4.4 % in May 2011 to 1.7 % in June 2011.

A comparison of production indices for total industry between June 2010 and June 2011 shows a varied picture across the Member States. At the top end of the range there was double-digit growth in the Baltic Member States – peaking at

23.7 % in Estonia – as well as in Belgium (11.9 % growth from May 2010 to May 2011). The latest information available shows that production expanded in 18 of the Member States when compared with the same month of the year before. Among those countries reporting a contraction in activity during this period, the largest losses were posted in Greece (-13.2 %), the United Kingdom (-5.3 %) and Denmark (-3.3 %).

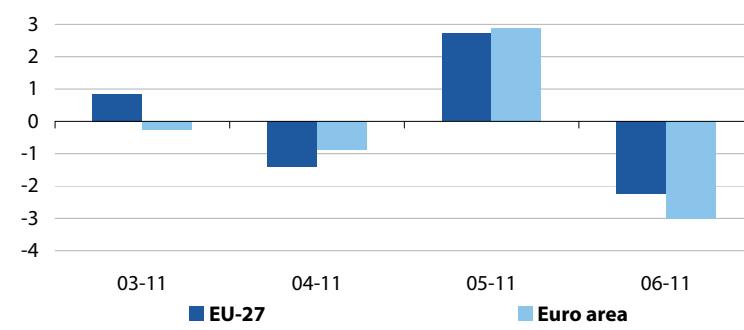

The downturn in EU-27 industrial activity in June 2010 was experienced across all of the main industrial grouping (MIGs), with the exception of energy-related activities, where output grew by 0.7 % in June 2011 – which represented an acceleration compared with the growth rate for May 2011 of 0.2 %. The largest contractions in EU-27 activity among the four remaining MIGs were recorded for the manufacture of capital goods (-2.7 %) and consumer durables (-2.4 %), while production fell by 1.3 % for the manufacture of intermediate goods and by 0.9 % for consumer non-durables. Both consumer goods producing groupings registered successive declines in output, with the reductions in activity in June 2011 being more pronounced than those registered in May 2011. These latest figures appear to be in line with weaker consumer demand, as the European Commission's Directorate-General for Economic and Financial Affairs reported EU-27 consumer confidence falling in June and July 2011.

The overall slowdown in industrial activity in June 2011 was apparent for almost all activities (as covered by NACE Rev. 2 divisions); there was a contraction in activity within the EU-27 for 25 out of 29 activities for which data are available.

**Figure 1.4:** Index of total new orders received for manufacturing industries working on orders, seasonally adjusted, growth rates compared with previous month (%)

**Figure 1.5:** Index of total new orders received for manufacturing industries working on orders (excl. heavy transport equipment), seasonally adjusted, growth rates compared with previous month (%)

Source: Eurostat ([sts\\_innogr\\_m](#))

The biggest losses (3.0 % or more between May and June 2011) were registered for the manufacture of tobacco products (Division 12), furniture (Division 31) and the other transport equipment (Division 30) and for the mining of coal and lignite (Division 05) and metal ores (Division 07).

### Index of new orders

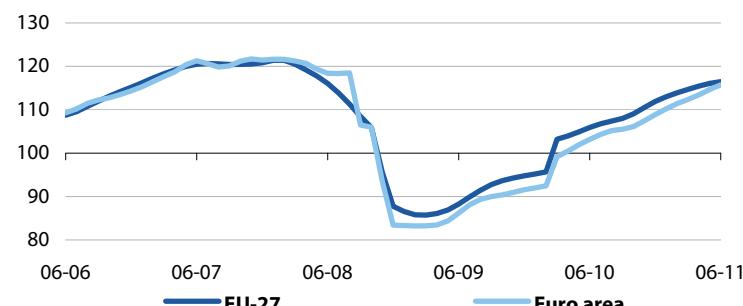

The seasonally adjusted index of total new orders for manufacturing industries working on orders reflected the developments already described for the index of production, insofar as the pace at which new orders were growing slowed considerably in the first half of 2011. Having peaked at 7.1 % in the second quarter of 2010, the EU-27 growth rate for total new orders slowed to 3.1 % in the final quarter of 2010, then to 2.9 % in the first quarter of 2011 before falling back to 1.9 % in the second quarter of 2011; all rates are given in relation to the previous quarter.

The slowdown was particularly apparent for the latest monthly data, as total new orders for the EU-27 fell by 0.3 % in June 2011 (compared with the month before), while a reduction of 0.7 % was

recorded in the euro area. The reduction in orders in June 2011 was most perceptible within national markets, as the index of domestic new orders fell by 7.7 % for the EU-27 and by 9.9 % for the euro area in June 2011.

The latest information for June 2011 shows that orders declined for the vast majority of manufacturing activities within the EU-27 on the basis of a comparison with the previous month. There were four activities where orders declined by more than 4 %: chemicals (Division 20), pharmaceuticals (Division 21), basic metals (Division 24) and electrical equipment (Division 27); the latter recording the biggest decline (6.0 %). The two transport equipment activities were the only NACE divisions to record an increase in orders in June 2011 within the EU-27, as orders for motor vehicles (Division 29) rose by 0.4 % and those for other transport equipment (Division 30) by 54.6 %. The latter, which includes the manufacture of railway equipment, aerospace and shipbuilding is characterised by an irregular order book, with volatile changes from one month to the next. The sudden increase in June 2011 likely resulted largely from aerospace orders placed during the Paris air show, as the French index for other transport equipment rose by 304 % between May and June 2011.

**Figure 1.6:** Total new orders received for manufacturing industries working on orders, trend cycle (2005=100)

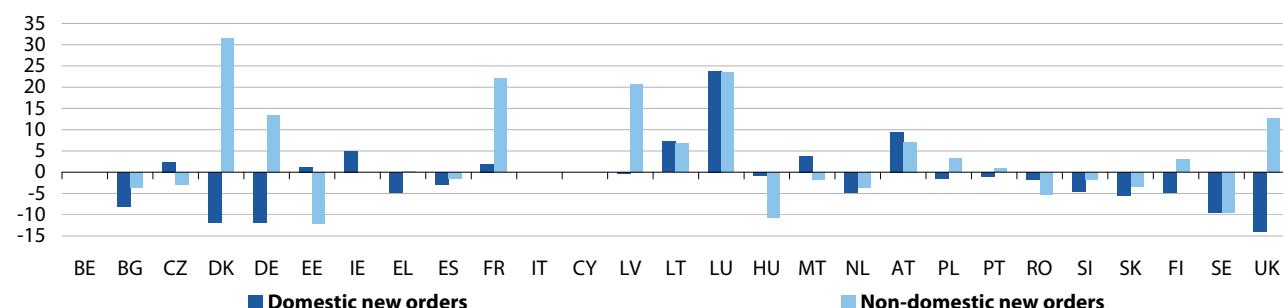

Source: Eurostat ([sts\\_inno\\_m](#))

### Indices of labour input

Short-term indicators for labour markets generally lag behind other measures: while output measures showed signs of a slowdown in activity, labour input indicators continued to gradually rise within the EU-27's industrial economy. The latest information available for the first quarter of 2011 shows that the seasonally adjusted index of employment for total industry increased by 0.2 % (compared with the previous quarter), reinforcing the gain of 0.3 % that was recorded in the final

quarter of 2010. There were diverging patterns of development across the Member States, as industrial employment rose by between 0.9 % and 1.5 % in the first or second quarter of 2011 in Germany, Poland, the Czech Republic, Romania, Hungary, Sweden and Latvia. In contrast, the industrial workforce in Greece and Ireland shed more than 2 %, while there were losses of between 1 % and 2 % in Slovenia and Bulgaria.

There was a more rapid expansion in the number of hours worked within total industry (compared with the expansion in persons employed), rising 1.3 % in the first quarter of 2011 in the EU-27. This latest rate was the fifth consecutive quarter of expansion or stability in industrial hours worked and also marked the highest quarter on quarter growth rate during this period.

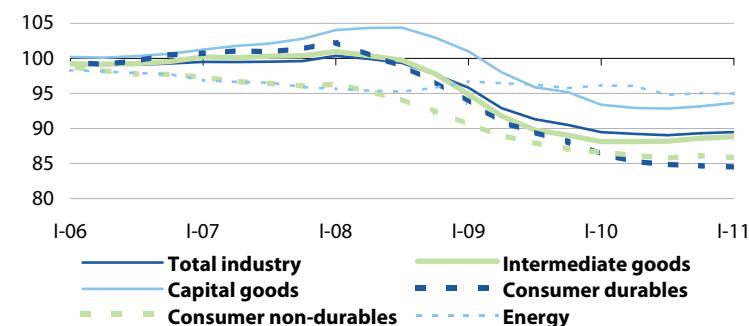

Wages and salaries in the EU-27's industrial economy also rose by 1.3 % between the final quarter of 2010 and the first quarter of 2011; this was almost twice as fast as the expansion recorded in the final quarter of 2011 (0.7 %). The latest growth rate marked the fastest expansion in wages and salaries within the EU-27's industrial economy since the first quarter of 2008 and also marked the fifth consecutive increase for this index.

## Index of prices

Having increased for 19 consecutive months up to and including April 2011, the EU-27's gross index of domestic industrial output prices fell by 0.3 % in May 2011 (when compared with the month before) and then remained stable in June 2011; a similar pattern was recorded in the euro area, as domestic output prices fell by 0.2 % in May 2011 and were unchanged in June 2011. Based upon a comparison with the same month of the previous year, domestic output prices rose by 6.8 % for the EU-27 and 5.9 % for the euro area in June 2011; these rates were about 1 percentage point below their most recent peak values recorded in April 2011 (7.8 % and 6.8 % respectively).

The relatively abrupt end to a lengthy period of price increases in the EU-27 can be attributed to price movement for energy products. In May 2011 domestic output prices for energy related activities fell by 1.3 % compared with the previous month, and this was followed in June 2011 by a further price reduction (-0.4 %). Part of this fall in prices may be associated with a downturn in the price of crude oil from the start of May 2011 as concerns surfaced over the strength of the global recovery and therefore future demand for oil.

Domestic output prices of coke and refined petroleum (NACE Rev. 2 Division 19) recorded the largest price reductions (across industrial NACE divisions) in June 2011, as prices fell by 0.7 % in both the EU-27 and the euro area. The falling price of oil was passed on to a range of related activities, such as electricity, gas, steam and air conditioning (Division 35, -0.4 % in the EU-27), chemicals (Division 20, -0.3 %), and pharmaceuticals (Division 21, -0.2 %).

## Construction

### Index of production

After a long period of contracting output (starting in early 2008), the EU-27's seasonally adjusted production index for construction showed an upturn (compared with the previous month) during the first three months of 2011; this was however short lived, as from April to June 2011 there was a period of no growth followed by a negative rate of change.

Month on month rates of change for EU-27 construction output ranged between 0 % and -1.3 % from April to June 2011. For civil engineering the movement from growth to contraction was relatively clear, with a smaller rate of increase in April (0.4 %) than had been recorded in the previous month, followed by no change in May, and a contraction of 0.8 % in June 2011. For building a small increase of 0.3 % was recorded in May 2011, sandwiched between stronger negative rates of change in April (-1.0 %) and June 2011 (-1.4 %).

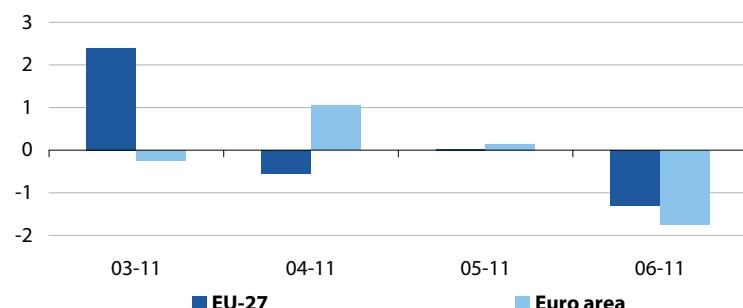

The 1.3 % decrease in EU-27 construction activity between May and June 2011 was driven by a relatively strong decrease in Germany (-4.5 %) and to a lesser extent by bigger decreases in some of the smaller Member States, notably Slovenia (-11.9 %) and Hungary (-5.5 %); France also recorded a very small decrease (-0.1 %).

### Indices of labour input

Although the quarter on quarter rates of change in EU-27 construction employment remained negative during 2010 and into 2011 the declines were generally less substantial than recorded during most quarters of 2009. For both the EU-27 and the euro area these latest negative rates of change were the twelfth consecutive quarter on quarter declines in construction employment.

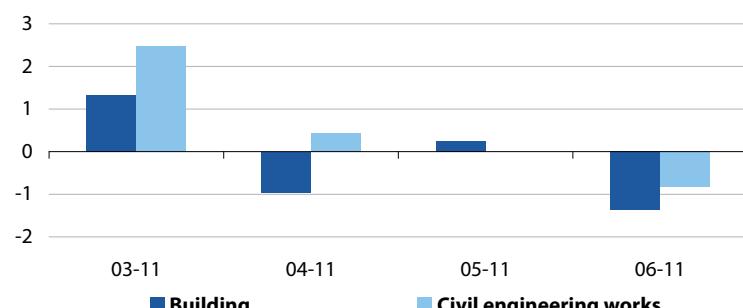

In contrast to employment, the EU-27's hours worked index was stable in the first quarter of 2011, after falling in the third and final quarters of 2010. The EU-27's index of wages and salaries in construction recorded growth of 1.6 % in the first quarter of 2011, following growth of 0.5 % in the last quarter of 2010. This was the first time consecutive quarters of growth in this index had been posted since the first quarter of 2008.

**Figure 1.14:** Index of production for construction, seasonally adjusted, growth rates compared with previous month (%)

**Figure 1.18:** Index of the number of dwellings for which building permits are issued for new residential buildings, seasonally adjusted, growth rates compared with previous quarter (%)

Source: Eurostat ([sts\\_cobpgr\\_q](#))

### Construction costs

In the first quarter of 2011 construction costs for new residential buildings rose by 1.5 % in the EU-27 when compared with the previous quarter (1.9 % in the euro area). This resulted in the construction costs index for the EU-27 moving above its relative high point prior to the financial and economic crisis (third quarter of 2008) and marked the seventh consecutive quarter on quarter increase.

Construction cost increases have been greater in the euro area than in the EU-27 since the first quarter of 2010. This is reflected in the rates of change comparing the first quarter of 2011 with the first quarter of 2010, as construction costs in the EU-27 rose 3.3 % during this period whereas in the euro area they rose 4.2 %.

**Table 1.4:** Indices of employment, hours worked and wages and salaries for construction, seasonally adjusted, growth rates compared with previous quarter, EU-27 (%)

	II-10	III-10	IV-10	I-11
Employment	-0.1	-0.6	-0.9	-0.5
Hours worked	0.8	-0.3	-0.6	0.0
Wages and salaries	-0.1	-1.3	0.5	1.6

Source: Eurostat ([sts\\_colbgr\\_q](#))

In the EU-27 material costs increased by 2.3 % in the first quarter of 2011, whereas the increase for labour costs was 1.2 % (when compared with the previous quarter). An analysis of the rates of change compared with one year earlier shows how these two indices are diverging, as material costs rose 6.2 % between the first quarters of 2010 and 2011 in comparison with a more modest 2.5 % increase for labour costs.

### Number of permits

The seasonally adjusted index of the number of building permits for dwellings in new residential buildings increased by 7.5 % in the EU-27 during the first quarter of 2011 (compared with the previous quarter), rebounding from a similarly strong fall (-6.8 %) in the final quarter of 2010. The situation in the euro area was very similar, with an increase of 7.0 % in the first quarter of 2011 following a reduction of 5.3 % in the final quarter of 2010. Nine of the Member States recorded double-digit increases for this index in the first quarter of 2011, including three of the largest Member States: the United Kingdom (15.2 %), France (14.1 %) and Spain (10.0 %), while the increase in Germany was only slightly lower (9.8 %).

The seasonally adjusted index of the useful floor area of office buildings for which building permits were issued increased by 1.9 % in the EU-27 during the first quarter of 2011 (compared with the previous quarter), while it fell 1.9 % in the euro area. For the EU-27 this represented a return to positive rates of change after a 7.9 % fall in the final quarter of 2010 which in itself followed two quarters of increases. Among the larger Member States Spain recorded a 23.3 % fall in this index in the first quarter of 2011, whereas the index was broadly stable in Germany (-0.7 %) and the United Kingdom (1.1 %), while France recorded a substantial increase (6.0 %).

## Services

### Volume of sales for retail trade

Having reached a low in August 2009, the trend cycle of the volume of sales in retail trade climbed gradually in the EU-27 through to September 2010 before falling back in the period to June 2011. In the euro area the same index grew from the same low point (August 2009), peaking a month earlier in August 2010, since when it has fallen continuously. It should be noted that the recent negative rates of change in the trend series have been quite small reflecting alternating months of modest increases and decreases in the index in its seasonally adjusted form. The overall magnitude of these changes can be shown by using the working day adjusted series to compare the latest index level for June 2011 with that of one year earlier, which shows an overall fall of just 0.4 % within the EU-27 and 0.6 % in the euro area.

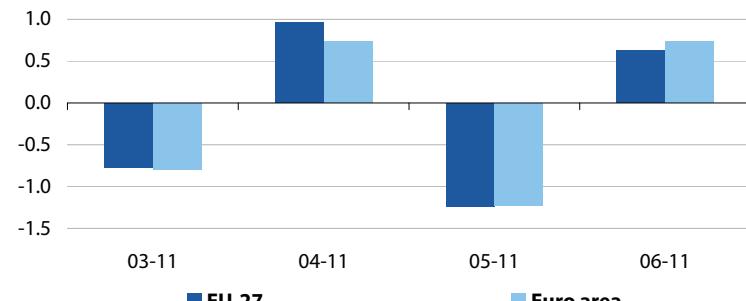

A similar analysis of working day adjusted indices for food, beverages and tobacco retailing shows that the EU-27's volume of sales index fell 1.1 % in the year to June 2011, compared with a fall of just 0.2 % for the euro area. For the retailing of non-food products (including fuel) the index rose 0.2 % in the EU-27, but fell 0.9 % in the euro area.

In June 2011 the seasonally adjusted index for the EU-27's volume of sales in retail trade grew 0.6 %. Seven of the Member States recorded a fall in their volume of sales index (data not available for four Member States), including Spain which recorded a reduction of 0.5 %. In contrast, eight Member States recorded an increase of 1.0 % or more, including a 4.5 % increase in Germany; France (0.7 %) and the United Kingdom (0.8 %) recorded more modest growth.

### Index of turnover

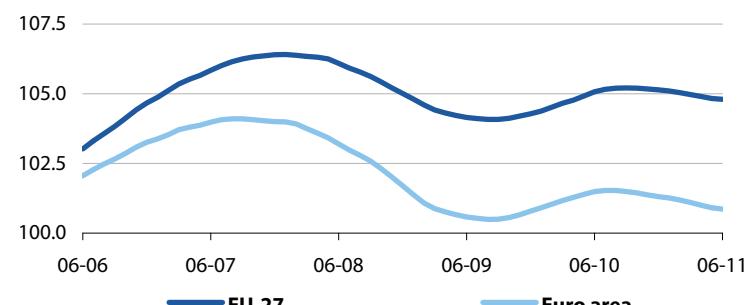

In the first quarter of 2011 the EU-27 seasonally adjusted turnover index for services (as covered by the STS Regulation) rose by 2.6 %. This extended the unbroken series of positive quarter on quarter rates of change to seven, marking an acceleration in growth as the rate of change was distinctly higher than in previous quarters. By the first quarter of 2011 the index level was 11.2 % higher than its most recent low point in the second quarter of 2009, and was within 1.4 % of its pre-crisis peak (registered in the second quarter of 2008).

The increase in the EU-27 services turnover index in the first quarter of 2011 was widespread with strong growth in activities across transport, distributive trades and business services. The strongest growth was recorded in employment activities (NACE Rev. 2 Division 78) where turnover grew 5.3 %, the sixth consecutive quarter of growth. Water transport (Division 50) recorded turnover growth of 4.7 %, following a contraction of 3.4 % in the final quarter of 2010. Wholesale trade (Division 46), legal and accounting activities (Division 69 and Group 70.2) and other professional, scientific and technical services (Division 74) all recorded growth just above 4 %. Due to its large weight, the 4.2 % growth in wholesale trade turnover had the strongest upward impact on the services turnover index, while the 1.2 % growth in retail trade (Division 47) turnover had the second largest impact. Only two of the services covered by the STS Regulation recorded a fall in turnover, -0.7 % for security and investigation activities (Division 80) and -0.2 % for publishing (Division 58), neither of which had a major effect on the overall index.

Most Member States reported services turnover growing in the first or second quarter of 2011 (compared with the previous quarter) with only seven countries recording a fall. Among the largest Member States, Germany and France recorded the fastest growth in services turnover, with gains of 2.8 % and 2.7 % respectively in the first quarter of 2011 and consequently had the greatest upward impact on the EU-27 average. The very high growth rate in Belgium (7.2 %), which was only lower than the 8.1 % growth in Lithuania, had the next greatest impact on the overall EU-27 average.

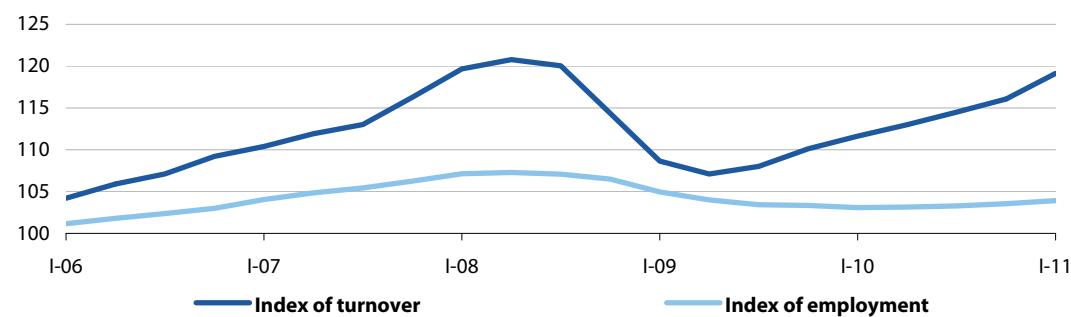

## Index of employment

In the first quarter of 2011 the EU-27's seasonally adjusted index of employment for services repeated the 0.3 % growth of the final quarter of 2010, extending the series of unbroken growth to four quarters. The index level for the EU-27 in the first quarter of 2011 was 0.8 % above the same quarter of 2010 (which was the recent low point for this index), but 3.1 % lower than its peak recorded in the second quarter of 2008.

The 1.0 % reduction in employment for motor trades (Division 45) was the biggest among the four service activities recording falling employment in the EU-27 during the first quarter of 2011; furthermore, it had by far the greatest downward impact on the services average. A similar fall (-0.9 %) was recorded in the smaller air transport sector (Division 51) while programming and broadcasting (Division 60) and water transport recorded very small reductions in employment. The fastest employment growth was recorded for postal and courier activities (Division 53, 1.8 %) and for computer programming (Division 62, 1.6 %). However, the 0.5 % increase for retail trade and the 0.6 % expansion for professional, scientific and technical services (part of Section M) had a greater upward impact on the EU-27 services average.

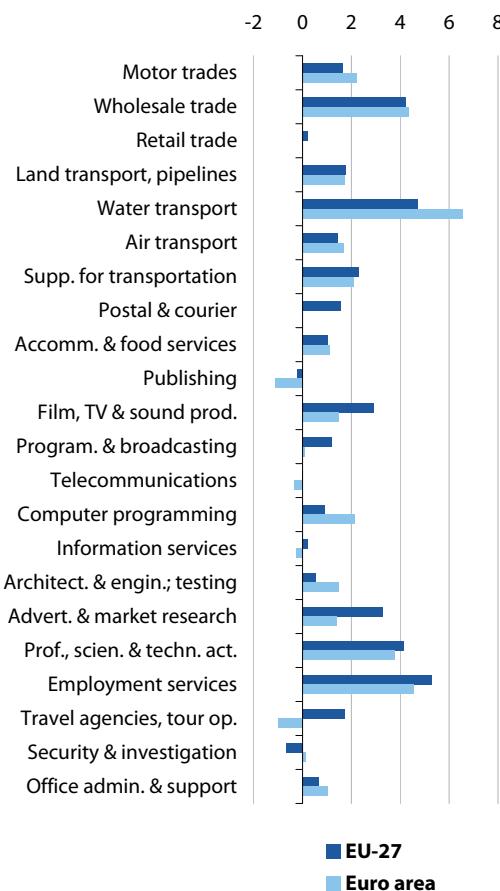

The latest rates of change (generally for the first or second quarter of 2011, data for Italy and the Netherlands are confidential) show services employment rose in the vast majority of Member States. In only six Member States did the index fall and the largest decrease was 1.1 % in Latvia. Six Member States recorded growth of 1 % or more; the highest rates were posted in Sweden (1.7 % in the first quarter of 2011) and Romania (1.6 % in the second quarter of 2011).

### Index of services prices

Among the services for which an EU-27 price index is available only sea and coastal water transport (Groups 50.1 and 50.2) and telecommunications (Division 61) recorded a decrease in prices in the first quarter of 2011, -1.1 % and -0.5 % respectively. For all other services price increases ranged between 0.5 % for employment activities and 1.1 % for postal and courier activities. These increases in the first quarter of 2011 marked the seventh consecutive quarter that the air transport price index had risen and the sixth consecutive quarter that the price index for freight transport by road had risen.

## Methodological notes

## Statistical sources

The data used in this publication is harmonised data supplied to Eurostat by the National Statistical Offices. Eurostat calculate the European aggregates for the EU-27 and euro area. Eurostat also perform some decomposition of indices (when these are not provided directly by the Member States), in order to produce other presentations of data (such as the trend cycle). Eurostat data are available free of charge at the following address <http://ec.europa.eu/eurostat>.

## Short-term statistics (STS) Regulation - the legal basis

The main basis of the information presented in this publication is the Council Regulation No 1165/98 of 19 May 1998 concerning short-term statistics (available at <http://eur-lex.europa.eu>), hereafter referred to as the STS-Regulation. Despite the major changes brought in by the STS-Regulation, and the great improvements in the availability and timeliness of EU indicators that followed its implementation by the Member States, strong demands for further development were voiced even as the STS-Regulation was being adopted. The emergence of the European Central Bank (ECB) changed expectations as regards STS. The STS Regulation was amended by Regulation (EC) No 1158/2005 of the European Parliament and of the Council of 6 July 2005 amending Council Regulation (EC) No 1165/98 concerning short-term statistics. Among the main changes introduced were:

- New indicators for the purpose of analysis, namely the introduction of industrial import prices, services output prices, and the division of non-domestic turnover, new orders and industrial output prices between euro area and non-euro area countries.
- More timely data, by shortening deadlines for the delivery of the industrial and construction production indices, the retail trade and services turnover (and volume of sales) indices, and employment indices for all activities.
- More frequent data, increasing the frequency of the production in construction index to monthly from quarterly.

## Classifications and related definitions

### Activity classifications

The economic activities used in this publication are defined in the Classification of Economic Activities within the European Communities, known as NACE. A revised version of the statistical classification of economic activities in the European Community (NACE Rev. 2) has been implemented in STS. Simultaneously with the introduction of NACE Rev. 2, a new base year (2005) was adopted for the indices to better reflect the economic structure.

The classification (NACE Rev. 2) has been modernised by introducing new detail to reflect different forms of production and emerging industries. The detail of the classification has substantially increased in service-producing activities. NACE Rev. 2 provides a better picture of the overall economy and facilitates international comparisons.

Note that within the services sector there are some special aggregates that have been produced to provide details of NACE Rev. 2 Sections M and N; these aggregates are not complete in terms of their coverage (footnotes are provided under tables and graphs whenever these aggregates are used within the publication).

## Main industrial groupings (MIGs)

The objective of the main industrial groupings (MIGs) is to provide an activity breakdown of industry (NACE Rev. 2 Sections B to E inclusive) which is an intermediate level between the Sections and the Divisions of NACE. There are five MIGs, which, despite the reference to 'goods', in fact regroup all activities without exception in NACE Sections B to E. These are:

- intermediate goods;
- capital goods;
- consumer durables;
- consumer non-durables;
- energy.

The definitions for each of the MIGs headings are based on the Division and Group level of NACE Rev. 2, these are defined by Commission Regulation (EC) No 656/2007 of 14 June 2007 amending Regulation (EC) No 586/2001 on implementing Council Regulation (EC) No 1165/98 concerning short-term statistics as regards the definition of main industrial groupings (MIGs). It should be noted that the MIGs are not comparable in terms of their (economic) size, the consumer durables heading is, in particular, smaller than the others. For new orders, the MIGs are defined as a sub-group of activities (limited to those manufacturing activities that work on orders).

## Classifications of types of constructions

The classification of types of constructions (CC) has been developed on the basis of the central product classification (CPC). The classification is a 4-level hierarchical system. The principal breakdown, at the Section level is between civil engineering and buildings. Below this level the CC differentiates primarily according to the technical design which results from the special use of the structure and, in particular for buildings, according to the main use. It should be noted that there is no legal basis for the CC. However, the publication of the CC contains many introductory remarks that provide definitions and classification guidelines, essential for a clear and coherent implementation of the classification. For more information on construction classifications see: CC, Eurostat, 14 March 1997.

## Variables/indicators

### Production index (industry and construction)

The production index provides a measure of the volume trend in value added at factor cost over a given reference period. The industrial production index is compiled for activities within NACE Rev. 2 Sections B, C and D. The production index for construction is compiled for building and for civil engineering. Dependent on the approximation method used (see below), the index of production should take account of:

- variations in type and quality of the commodities and of the input materials;
- changes in stocks of finished goods and services and work in progress;
- changes in technical input-output relations (processing techniques);
- services such as the assembling of production units, mounting, installations, repairs, planning, engineering, creation of software.

The data necessary for the compilation of such an index are generally not available on a sub-annual basis. In practice, suitable proxy values for the compilation of the indices are needed.

#### Industry:

- gross production values (deflated);
- volume data;
- turnover (deflated);
- work input;
- raw material input;
- energy input.

#### Construction:

- input data (consumption of typical raw materials, energy or labour);
- output data (production quantities, deflated production values or deflated sales values).

### **Turnover (industry, retail trade and services)**

The objective of the turnover index is to show the evolution of the market for goods and services. Turnover comprises the total invoiced by the observation unit during the reference period. This corresponds to market sales of goods or services supplied to third parties. It excludes all duties and taxes on the goods or services invoiced by the unit including the VAT invoiced by the unit vis-à-vis its customer and other similar deductible taxes directly linked to turnover. For industry, the turnover index is compiled for domestic and non-domestic markets, with the latter split between euro area and non-euro area markets. The domestic market is defined as customers resident in the same national territory as the observation unit.

### **Volume of sales (retail trade)**

The volume of sales represents the value of turnover in constant prices and as such is a volume index. It can be calculated as turnover at current prices deflated by the deflator of sales, or derived directly from the quantity of goods sold. The index is a business cycle indicator that shows the activity of the retail sector in volume. It is a short-term indicator for final domestic demand. The index is often interpreted as a consumer confidence indicator. It is compiled for NACE Rev. 2 Division 47 and its components at the Group and Class level.

### **New orders (industry and construction)**

The objective of the new orders received index is to assess the evolution of total demand for products and services as an indication of future production. The coverage of the industrial new orders index includes NACE Rev. 2 Divisions 13, 14, 17, 20, 21, 24, 25, 26, 27, 28, 29 and 30. Given the volatile nature of orders within the activity of other transport equipment, a special aggregate for manufacturing industries working on orders, excluding transport equipment has been created. For the industrial index a distinction is made between orders on domestic and non-domestic markets, with the latter further split between euro area and non-euro area markets. The coverage of the construction new orders index includes NACE Rev. 2 Divisions 41 and 42.

The new orders index refers to goods and services that are to be provided by the observation unit, including those originating from sub-contractors. An order is defined as the value of the contract linking a producer and a third party in respect of the future deliveries by the producer of goods and services. The order is accepted if, in the producer's judgement, there is sufficient evidence for a valid agreement. New orders exclude all duties and taxes on the goods or services that will be invoiced by the unit, including VAT and other similar deductible taxes directly linked to turnover. All other charges (for example, transport or packaging) passed on to the customer are also included. Note that cancellations of orders are not deducted from the orders received.

### **Employment (all activities)**

The employment index shows the evolution of employment. The index is defined as the total number of persons who work in the observation unit (including working proprietors or partners and unpaid family workers), as well as persons who work outside the unit, but who belong to it and are paid by it (for example, sales representatives, delivery personnel, repair and maintenance teams). Part-time workers are included as well. Excluded is manpower supplied to the unit by other enterprises. Member States can use the number of employees as an approximation of the number of persons employed.

### **Hours worked (industry and construction)**

The index shows the evolution of hours worked. The index represents the aggregate number of hours actually worked during normal working hours, during overtime and covers the time that is spent at the place of work on tasks such as preparing the site and time corresponding to short periods of rest at the work place. This variable excludes hours paid but not actually worked such as for annual leave, holidays and sickness leave. If the exact number of hours actually worked is not known, it may be estimated on the basis of the theoretical number of working hours and the average rate of absences (for example, sickness or maternity).

### ***Wages and salaries (industry and construction)***

The gross wages and salaries index approximates the development of the wages and salaries bill. Wages and salaries are defined as the total remuneration, in cash or in kind, payable to all persons counted on the payroll (including homeworkers), in return for work done during the accounting period. This is regardless of whether the wages are paid on the basis of working time, output or piecework and whether they are paid regularly or not. Included are all basic wages and salaries, allowances, bonuses and commissions, taxes, contributions and other amounts payable by employees and withheld at source by the employer. Social contributions, taxes or other labour cost expenditure paid by employer, training costs, reimbursements for equipment or travelling, and similar costs are not included.

### ***Output prices / producer prices (industry)***

The output price index (or producer price index) shows monthly price changes in industrial activities, which can be an indicator of inflationary pressure before it reaches the consumer. The indices are compiled for activities within NACE Rev. 2 Sections B, C and D, as well as Division 36. Output price indices are compiled for the domestic and the non-domestic market, with the latter further split between euro area and non-euro area markets. Given the volatile nature of energy prices, a special aggregate for total industry excluding energy has been created, so that underlying price developments may be studied.

All price-determining characteristics of the products should be taken into account, including the quantity of units sold, transport provided, rebates, service conditions, guarantee conditions and destination. The appropriate price is the basic price that excludes all duties and taxes on the goods and services invoiced by the unit including VAT invoiced by the unit vis-à-vis its customer and similar deductible taxes directly linked to turnover. Subsidies on products received by the producer, if there are any, should be added. The actual transaction price should be measured, and not a list price. If transport costs are included this should be part of the product specification. The price of period t should refer to the moment

when the order is made, not the moment when the commodities leave the factory gates. The measured price should in principle reflect the average price level during the reference period. In practice, the information actually collected may refer to a particular day in the middle of the reference period that should be determined as a representative figure for the reference period.

### ***Output prices (services)***

Regulation 1158/2005 of the European Parliament and the Council amended the original STS Regulation and introduced a requirement for producer price indices for a selection of service activities (SPPIs). A selection of the available data is presented in this publication. SPPIs are presented with an average base year of 2006=100. The first quarter of 2006 was the first reference period for which SPPIs were required, although many Member States had derogations to start providing data later than this. The basic form of the index is its gross (also known as unadjusted) form. The information is collected each quarter (no monthly presentation is available). For services, the following specific points apply.

- Output prices for services show the price development for services delivered to customers that are enterprises or persons representing enterprises, referred to as B2B (business to business) prices – for some activities where sales to households are also significant a B2All price index is also of interest.
- The appropriate price measure is the transaction price. The price should take into account any discounts, rebates, surcharges, etc. that may apply. Taxes on products should be excluded from prices whereas subsidies on products received by the producer, if there are any, should be added.
- The price should be recorded at the date of delivery of the service. If the service delivery spans over several time periods, appropriate adjustments have to be made.

More information on SPPIs is available from the Methodological guide for developing producer price indices for services (Eurostat product code KS-BG-06-003).

### **Import prices**

Import price indices aim to measure the transaction price development of imported goods purchased from non-domestic areas by domestic residents. All the related services are initially excluded from the scope. The price indices should track the price movements of comparable items over time. It is essential that all price-determining characteristics of the products are taken into account, including quantity of units sold, transport provided, rebates, service conditions, guarantee conditions origin and destination. The specification must be such that in subsequent reference periods, the observation unit is able uniquely to identify the product and to provide the appropriate price per unit. The product coverage is limited to Sections B, C and D of the Classification of Products by Activity (CPA) - related services are excluded.

The price is the c.i.f. (cost, insurance, and freight) price at the border excluding all duties and taxes on the goods and services to be shouldered by the observation unit. The price should be an actual transaction price, and not a list price, therefore discounts should be deducted from the price. The price index compilation should take into account and adjust for quality changes in products. Imports are recorded when the ownership of the goods is transferred (i.e. when the parties record transaction in their books or account).

The distinction between markets (domestic, non-domestic, euro area, non-euro area) requires separate indices to be compiled according to the origin/destination of the product, which is determined by the residency of the third party that has supplied/ordered/purchased the product. These markets are defined using a consistent composition of the euro area based on 17 countries.

### **Construction costs**

The construction costs index measures the trend of prices for the factors that are involved in the construction process; hence the evolution of the costs incurred by the contractor. Costs that constitute components of construction costs also include plant and equipment, transport, energy and other costs. Architect's fees are not part of construction costs. The index does not take account of changes in productivity or of variations in the contractor's profit margin. In certain countries, it is also called a 'factor price index'. This index covers costs for new residential buildings excluding residencies for communities.

An output price index is used by some Member States as a proxy for construction costs.

### **Building permits (construction)**

Two permits indices are compiled, one for the number of dwellings for which permits have been issued, and the other for the area authorised. The objective of building permits indices is to assess the future development of construction activity. A building permit is an authorisation to start work on a building project. As such a permit is the final stage of planning and building authorisations, prior to the start of work. It may be the case that a large proportion of permits are not used or there is a long time lag between permits and the start of the building project, however, the index gives indications of the workload for the building industry in the near future.

Number of dwellings: indices of the number of dwellings are compiled for one-dwelling residential buildings and residential buildings with two and more dwellings. A dwelling is a room or suite of rooms and its accessories in a permanent building or structurally separated part thereof, which by the way it has been built, rebuilt, converted and so on, is intended for private habitation. It should have separate access to a street or to a common space within the building. Detached rooms or habitation which are clearly to be used as a part of the dwelling should be counted as part of the dwelling. A dwelling may thus be constituted of separate buildings within the same enclosure, provided they are intended for habitation by the same household.

Area: this index is compiled from the square metre of useful floor area of buildings for which permits have been granted. This index is compiled for all types of buildings. The useful floor area of a building is measured within its external walls, excluding construction areas, functional areas for ancillary use (for example, areas occupied by heating and air-conditioning installations or power generators) or thoroughfares (for example, areas of stairwells, lifts, escalators). Alternative volume measures may be used.

## Base years/weights

European short-term business statistics are presented with 2005 as the base year. Generally Member States compile their data using weights from 2005. The following table shows the weights that are generally used for each indicator, although some countries may use alternative weights.

### Weights used for each indicator in STS

Index	Used weight
Production	Value added at factor costs
Turnover	Turnover
Domestic turnover	Domestic turnover
Non-domestic turnover	Non-domestic turnover
New orders	Turnover
Domestic new orders	Domestic turnover
Non-domestic new orders	Non-domestic turnover
Employment	Number of persons employed
Hours worked	Number of hours worked
Wages and salaries	Wages and salaries
Output prices	Turnover
Domestic output prices	Domestic turnover
Non-domestic output prices	Non-domestic turnover
Import prices	Imports
Permits	Turnover

## Decomposition - forms of indices

The use of time series decomposition makes it possible to determine sub-annual growth rates that are easier to interpret and provides a means to establish long-term developments uninfluenced by seasonal and sub-annual factors. The normal breakdown of a gross or unadjusted time series makes it possible to identify the trend, the cycle, the seasonal variation and the erratic fluctuations.

## Adjustment of working days

The adjustment of working days is intended to adjust for calendar effects, whatever their nature. The number of working days for a given month depends on the timing of certain public holidays, the possible overlap of certain public holidays and non-working days, the fact that a year is a leap year or not, and other reasons. Short-term statistics (STS) are often strongly affected by calendar issues. For example, there may be close connections between industrial production and the hours worked or between retail sales and the number of trading days. In order to ensure comparability of these statistics across time the data need to be working-day adjusted. Two issues determine the outcome of working-day adjustment:

- the adjustment method, in other words proportional or regression methods;
- the number of working days, in other words how many working days (or more generally how much working time) there are in a month (or other reference period).

## Seasonal adjustment

Seasonal adjustment, or the adjustment of seasonal variations, aims, after adjusting for calendar effects, to take account of the impact of the known seasonal factors that have been observed in the past. For example, in the case of the production index, annual summer holidays have a negative impact on industrial production. The level of this impact varies according to the country being studied and whether or not observation units close. It also depends on the area of activity concerned. In addition, the situation is complicated as these practices/habits/traditions change over time. Most series, with the notable exception of prices, are seasonally adjusted. If the national statistical office providing the data does the seasonal adjustment, these series are used. If no seasonally adjusted series are supplied, Eurostat perform the seasonal adjustment.

### Trend cycle

The trend is a slow variation over a long period of years, generally associated with the structural causes of the phenomenon in question. In some cases the trend shows a steady growth, in others, it may move either downwards or upwards. The cycle is a quasi periodic oscillation, characterised by alternating periods of higher and lower rates of change possibly, but not always, involving expansion and contraction. In most cases it is related to fluctuations in overall economic activity. If the irregular component of the time series is relatively important, the trend cycle series generally offers a better series for analysis of longer-term past developments. However, this advantage is less clear when analysing very recent developments. Trend cycle values for recent periods may be subject to greater revisions than the equivalent seasonally adjusted values and hence the latter may be more appropriate for the analysis of very recent developments. This is particularly true around turning points. Trend cycle series may however converge to stable results more quickly than seasonally adjusted series.

### Growth rates

The changes, which are given in the tables and graphs in this publication, show two different growth rates. The first being for the latest period compared with the previous period (for example, month on month or quarter on quarter) - here a seasonally adjusted series is used wherever possible. The second growth rate is for the latest period compared with the same period of a year before: here a series only adjusted for the number of working days is used wherever possible, else the indices used are unadjusted (in other words, gross series).

### EU-27 and euro area aggregates

EU-27 and euro area data are first estimated when 60 % of the weighted national data is available. These geographical aggregates are calculated for unadjusted/gross series and for working day adjusted series, and from these two basic forms, seasonally adjusted and trend cycle forms are derived using TRAMO & SEATS. Missing components for these two geographical aggregates are estimated using the average growth rate of the available components and the past data of the missing components.

Growth rates and indices for the euro area are consistently based on an aggregate of the 17 Member States that, at the time of writing, use the euro as a common currency.

### European aggregates and countries

EU-27	27 Member States of the European Union
Euro area	17 Member States that use the euro as a common currency
BE	Belgium
BG	Bulgaria
CZ	the Czech Republic
DK	Denmark
DE	Germany
IE	Ireland
EE	Estonia
EL	Greece
ES	Spain
FR	France
IT	Italy
CY	Cyprus
LV	Latvia
LT	Lithuania
LU	Luxembourg
HU	Hungary
MT	Malta
NL	the Netherlands
AT	Austria
PL	Poland
PT	Portugal
RO	Romania
SI	Slovenia
SK	Slovakia
FI	Finland
SE	Sweden
UK	the United Kingdom
NO	Norway
CH	Switzerland

## **HOW TO OBTAIN EU PUBLICATIONS**

### **Free publications:**

- via EU Bookshop (<http://bookshop.europa.eu>);
- at the European Union's representations or delegations. You can obtain their contact details on the Internet (<http://ec.europa.eu>) or by sending a fax to +352 2929-42758.

### **Priced publications:**

- via EU Bookshop (<http://bookshop.europa.eu>).

### **Priced subscriptions (e.g. annual series of the *Official Journal of the European Union* and reports of cases before the Court of Justice of the European Union):**

- via one of the sales agents of the Publications Office of the European Union ([http://publications.europa.eu/others/agents/index\\_en.htm](http://publications.europa.eu/others/agents/index_en.htm)).
